Ford Falcon BF & FG

ENGINEERING THE UNFAIR ADVANTAGE

Heat Exchanger Kit

PWO52900 - Ford Falcon BF & FG 6-Cylinder
ZF 6-Speed Transmission Heat Exchanger Kit

NEW PRODUCT RELEASE

The PWR Transmission Heat Exchanger kit is an easy to fit DIY kit designed to be mounted beneath the passenger side transmission crossmember and replaces the factory OEM heat exchanger and associated lines to the transmission. The kit requires no modification to the car and includes additional heater hoses, high flow 1/2" oil hoses, billet transmission adapters and various fittings with full fitting instructions.

Consistent transmission oil temperatures and unrestricted oil flow are the key requirements for a properly functioning ZF 6-Speed transmission, with our primary focus being reliability.

The PWR Heat Exchanger is a very robust, all aluminium construction unit, featuring a complex tube and fin internal core. This large 3"x3"x8" core is made up of thick-wall extruded tubes carrying the coolant flow, whilst the multiple pass baffle configuration within the shell guides the oil flow through a fine, yet robust turbulence fin in-between each tube. This innovative design provides maximum liquid to surface contact on both water and oil passages, yet remains very unrestrictive to either fluid flow. The result is very reliable, high heat transfer Oil Cooler in a low pressure drop configuration made 100% in Australia from the finest material and craftsmanship.
